

SPECIAL ISSUE ON ADVANCED MICRO/NANOMATERIALS FOR VARIOUS SENSOR APPLICATIONS (SELECTED PAPERS FROM ICASI 2021): PART 2

PREFACE

IEEE 7th International Conference on Applied System Innovation 2021 (IEEE ICASI 2021) was successfully held in Alishan, Chiayi, Taiwan, on September 24–25, 2021. IEEE ICASI 2021 provides an opportunity for researchers around the world to communicate, facilitating collaborations and networking between science and engineering technologists in academic, industrial, global, and interdisciplinary fields. The scope of IEEE ICASI 2021 includes numerous topics, such as innovative design, information science, industrial design, computer science, applied mathematics, mechanical engineering, electrical and electronic engineering, green technology and architectural engineering, automation engineering, material science, cultural and creative research, and other related professional fields.

This special issue of Sensors and Materials contains nine outstanding papers related to sensor fabrication and IoT applications selected from the papers presented at ICASI 2021. All articles were examined rigorously and impartially by the reviewers, with the acceptance of papers only after reviews conducted by the guest editors, reviewer advice, mandatory revisions, and a final proofread. This publication is expected to be a key issue of Sensors and Materials.

I would like to thank all the authors for their significant contributions and the reviewers for their constructive comments. In addition, I give special thanks to the leader of the Editorial Department, Ms. Misako Sakano, and Ms. Naoko Makino for their invaluable help in the review and publication process and to Editor-in-Chief Prof. Makoto Ishida for his untiring support in the publication of this issue.
